Guide for completing MANGO Welder Qualification Date Report

Each number below corresponds to a section on the welder qualification data report for the MANGO procedure number 2

- 1) Circle whichever test is being performed.
 - a. Initial if first time qualifying or requalifying after certification has lapsed.
 - b. 6 Month ReQual. If time elapsed since previous welding test has not exceeded 7 ½ months.
- 2) Check to ensure the proper form is being used
 - a. MANGO 1 for welding with E6010 electrodes.
 - b. MANGO 2 for in-service welding with E7018 electrodes.
- 3) Date test welds are completed by welder.
- 4) Full name of welder performing test welds.
- 5) Name of company or contractor authorizing/requesting test if applicable.
- 6) Name of testing facility/lab administering test.
- 7) Welder identification used on test parts.
- 8) Employee number of welder taking weld test, if applicable.
- 9) Facility where weld test was performed.
- 10) Temperature at site of welding test.
 - a. Ambient temperature below 40°F or the presents of moisture in test material will require preheat.
- 11) Weather conditions if testing is performed outdoors.
- 12) Material grade.
 - a. Material must conform to the requirements of API 1140.
 - b. Mill test report number for material should be listed if available.
 - c. Mill test report may be referenced if material type comes into question.
- 13) Outside diameter and wall thickness of test material.
- 14) Direction of weld travels, must be up hill for MANGO 2.
 - a. Direction of travel must be monitored throughout the testing process.
- 15) Verify test weld sample is in the correct orientation throughout the test.
- 16) Brand and model of welding machine used for test.
- 17) Sleeve material grade.
 - a. Material must conform to the requirements of API 1140.
 - b. Mill test report number for material should be listed if available.
 - c. Mill test report may be referenced if material type comes into question.
- 18) The wall thickness of the sleeve material must be listed.
- 19) The welding polarity used during the test must be verified before and during the test.
- 20) Check if test was conducted with water flowing through the pipe.
 - a. Flowing water must be used during initial qualification.
 - b. A minimum of ¾ GPM flow should be used.
- 21) Information on each line will correspond with the pass being ran for the seam/groove weld.
 - a. Readings are required for at least one bead on each pass

- b. Additional readings may be taken and listed as desired.
- 22) The process being uses must be listed.
 - a. MANGO 2 uses the SMAW process only.
- 23) Size of filler rod being used.
 - a. Reference MANGO No. 2 Welding Procedure Specifications for specific parameters based on size of filler rod being used.
- 24) Type of electrode being used.
 - a. E7018 must be used for MANGO 2
 - b. Electrodes must be stored in accordance to AWS standard D1.1 for low hydrogen electrodes prior to use.
 - i. Electrodes not stored properly cannot be used for MANGO 2 welds or test.
- 25) The amperage must be checked, with a calibrated meter, during welding and recorded
 - a. The amperage recorded must be listed
 - b. Amperage reading(s) must be listed for at least one bead on each pass.
 - c. Reading outside the ranges listed in MANGO 2 will result in a failed test.
- 26) The voltage must be checked with a calibrated meter, during welding and recorded
 - a. The voltage recorded must be listed
 - b. Voltage reading(s) must be listed for at least one bead on each pass.
 - c. Reading outside the ranges listed in MANGO 2 will result in a failed test.
- 27) The heat input for each bead recorded must be calculated.
 - a. Heat input reading below 14 KJ/in will result in a failed test.
- 28) The time from the end of one pass to the beginning of the next pass being must be listed.
 - a. If time exceeds 5 minutes preheating may be required.
- 29) Travel speed for each bead recorded must be calculated.
 - a. Travel speeds outside the ranges listed in MANGO 2 will result in a failed test.
- 30) Method used to clean between passes shall be listed.
- 31) Recorded all information for at least on bead on each pass for the upper fillet weld as listed in 22 thru 30 above.
- 32) Recorded all information for at least on bead on each pass for the lower fillet weld as listed in 22 true 30 above.
- 33) Preheat temperature if used.
 - a. Preheat temperature shall be 250°F for 3" on both sides of the weld when required.
- 34) Post heat temperature if used.
- 35) If voltage is measured across terminal at the machine check box. Voltage should be measured as close to electrode and work as possible to ensure accurate readings due to voltage drop.

Page 2

The weld must pass a visual inspection, by a qualified inspector, in accordance with API 1104 before it can be destructively tested.

- 36) This must be marked the same as 1 above.
- 37) List welder name or I.D. mark as listed in 6 above.
- 38) All welds must pass a visual inspection prior to destructive test.
 - a. Qualified inspector mark pass or fail for visual inspection, list name of inspector and date welds passed visual inspection.

- 39) This area is for recording results of destructive tests.
 - a. Reference MANGO Welding Procedure No.2, drawing sheet 2 of 2 and section 6 of API 1104 for location of test samples.
- 40) One tensile test coupon is required
 - a. The tensile test coupon may be omitted, in which case an additional Nic-break test would be required.
 - b. All information for the tensile test coupon shall be filled in.
 - c. If the test fails, the reason for failure shall be noted accordingly.
- 41) If additional tensile test are performed the specimen shall be marked and recorded.
- 42) Test material ½"or less shall subject to one face bend.
 - a. Reference MANGO Welding Procedure No.2, drawing sheet 2 of 2 and section 6 of API 1104 for location of test samples.
 - b. Test material greater than $\frac{1}{2}$ " shall be subject to two side bends.
- 43) If second face bend is performed results may be recorded here.
- 44) Test material ¹/₂"or less shall subject to one root bend.
 - a. Reference MANGO Welding Procedure No.2, drawing sheet 2 of 2 and section 6 of API 1104 for location of test samples.
- 45) If a second root bend is performed the results may be recorded here.
- 46) The test weld shall be subject to one Nick Break test.
 - a. Reference MANGO Welding Procedure No.2, drawing sheet 2 of 2 and section 6 of API 1104 for location of test samples.
- 47) A second Nick Break may be performed in place of a tensile test.
 - a. Reference MANGO Welding Procedure No.2, drawing sheet 2 of 2 and section 6 of API 1104 for location of test samples.

Fillet Weld destructive test results.

- 48) A minimum of four nick break shall be tested from the fillet welds.
 - a. Two nick breaks will come from the lower fillet welds.
 - b. Two nick breaks will come from the upper fillet welds.
 - c. Reference MANGO Welding Procedure No.2, drawing sheet 2 of 2 and section 6 of API 1104 for location of test samples.
- 49) Name of qualified inspector who conducted destructive test.
- 50) Date weld test were successfully completed.
- 51) If weld failed list date of failure.
- 52) Date will be 6 months from date test weld was complete.
- 53) Inspector notes.
 - a. If the test is a fail the reason for failure should be noted here.
